

Thomas Heatherwick has completed Boiler Suit, an undulating facade of woven steel panels encasing the boiler house at Guy's Hospital in London. At the centre of the scheme is the Boiler Suit, a unique façade designed to encase the boiler house which powers Guy's Hospital. The Boiler Suit is made up of 108 undulating tiles of woven stainless steel braid and is illuminated at night to provide a distinctive welcoming beacon for staff and visitors arriving at hospital in the dark.
